WALT'S WATCH LAB

AUTOMATIC WATCH GUIDE

As you wear your watch, wrist movement winds the spring that powers the hands.

WALTON custom watches

FIND YOUR CROWN POSITION

If the crown screws down, unscrew it first. Count each stop as you pull gently.

Fully in

Turn the crown to wind by hand, if supported.

First click

Quickset the date or day, if fitted, outside calendar-change hours.

Second click

Turn the crown to move the hour and minute hands.

Crown positions and functions may vary by watch.

SET THE DATE AND TIME

Find midnight

To set both date and time, use the first click to quickset yesterday's date. At the second click, advance the hands until the date changes to today. That's midnight.

Set local time

At the second click, continue forward to the correct time. For a PM time, pass noon first. Then push the crown fully in.

IMPORTANT TO REMEMBER

Close the Crown

Push the crown back against the case. If it screws down, gently screw it back into place.

Power Reserve

How long your watch runs off the wrist depends on the movement and how fully the spring is wound.

Starting a stopped watch If it winds only by motion, gently rock it in your hand.
